

Lab 5 – Managing Group Accounts

Task 1: Create and Manage Security Groups

Step 1: Create GG_HR_Admins using ADAC
System: DC107 (Primary Domain Controller for vlabs07.com)

Explanation:

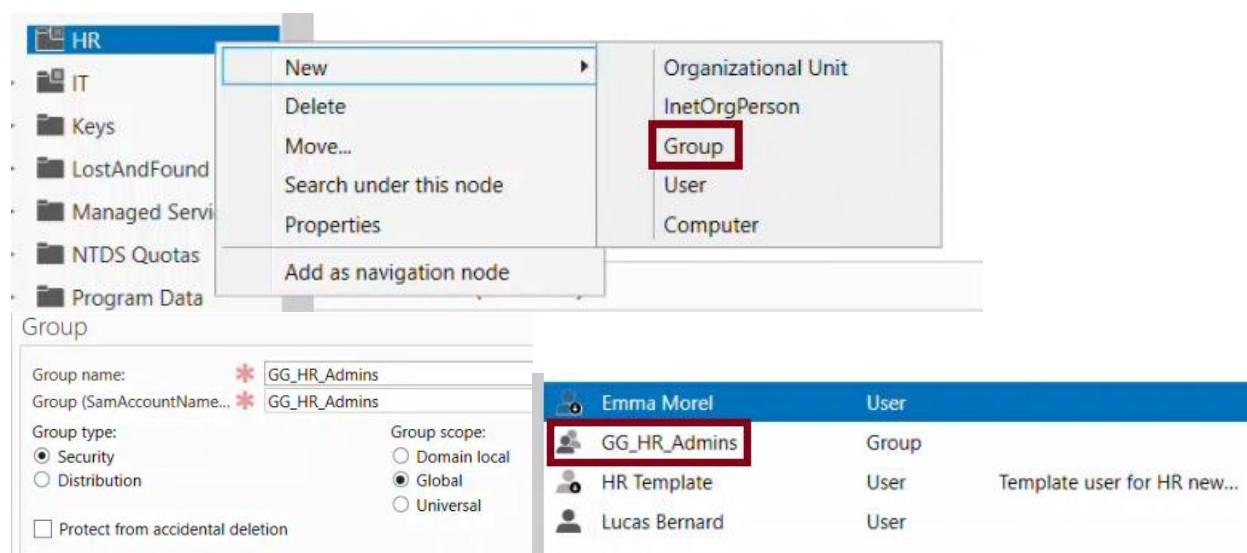

We used Active Directory Administrative Center (ADAC) on DC107 to create a new Global Security Group called GG_HR_Admins inside the HR Organizational Unit.

This group will be used to assign permissions to HR administrators in the domain.

Steps:

- Log in to DC107
- Open Active Directory Administrative Center
- Navigate to the vlabs07.com domain
- Go to the HR OU
- Click "New > Group"
- Enter the following:
 - Name: GG_HR_Admins
 - Group scope: Global
 - Group type: Security
- Click OK to create the group

Screenshot:

■ Step 2: Create GG_IT_Admins using PowerShell
System: DC107 (**Continue using** the same server)

Command:

```
-----  
New-ADGroup `n`  
  -Name "GG_IT_Admins" `n`  
  -GroupScope Global `n`  
  -GroupCategory Security `n`  
  -Path "OU=IT,DC=vlabs07,DC=com" `n`  
  -SamAccountName "GG_IT_Admins"
```

Explanation:

This command creates a Global Security Group named GG_IT_Admins in the IT Organizational Unit of the vlabs07.com domain.

- -Name defines the groups display name
- -GroupScope Global allows the group to be used for permissions across domains (members must be from this domain)
- -GroupCategory Security marks it as usable for ACLs (access control)
- -Path tells AD to place the group inside the IT OU
- -SamAccountName is the legacy-compatible login name

To confirm the group was created successfully, run:

```
Get-ADGroup -Identity "GG_IT_Admins"
```

Screenshot:

```
PS C:\Users\Administrator> New-ADGroup -Name "GG_IT_Admins" -GroupScope Global -GroupCategory Security -Path "OU=IT,DC=vlabs07,DC=com" -SamAccountName "GG_IT_Admins"  
PS C:\Users\Administrator> Get-ADGroup -Identity "GG_IT_Admins"  
  
DistinguishedName : CN=GG_IT_Admins,OU=IT,DC=vlabs07,DC=com  
GroupCategory     : Security  
GroupScope        : Global  
Name              : GG_IT_Admins  
ObjectClass       : group  
ObjectGUID        : 32debdec-fbde-4547-9476-492c4273bc00  
SamAccountName    : GG_IT_Admins  
SID               : S-1-5-21-2428485534-1961598418-1246186656-1116
```

■ Step 3: Verify Group Creation (GG_HR_Admins and GG_IT_Admins)
System: DC107

Command:

```
-----  
Get-ADGroup -Filter * | Where-Object { $_.Name -in @("GG_HR_Admins", "GG_IT_Admins") } | Select-Object Name, GroupScope, DistinguishedName
```

Explanation:

```
-----  
This command checks that both security groups exist in Active Directory and confirms their scope and location.
```

Keyword breakdown:

- **Get-ADGroup -Filter ***
 - Retrieves all groups **in** Active Directory.
- **Where-Object { \$_.Name -in @("GG_HR_Admins", "GG_IT_Admins") }**
 - Filters the list to only include groups whose Name matches either "GG_HR_Admins" or "GG_IT_Admins".
 - `\$_` refers to the current object **in** the pipeline.
 - `-in` is used to check **if** the **group** name is **in** the list provided with `@(...)`.
- **Select-Object Name, GroupScope, DistinguishedName**
 - Selects and displays only these specific fields:
 - **Name**: shows the group's display name.
 - **GroupScope**: confirms **if it** is Global, Universal, or DomainLocal.
 - **DistinguishedName**: shows the full path to **where** the **group** is stored **in** Active Directory.

This is a good way to double-check that the groups were created **in** the right OU and with the correct scope.

Screenshot:

```
-----  
PS C:\Users\Administrator> Get-ADGroup -Filter * | Where-Object { $_.Name -in @("GG_HR_Admins", "GG_IT_Admins") } | Select-Object Name, GroupScope, DistinguishedName  
  
Name      GroupScope DistinguishedName  
----  
GG_HR_Admins   Global CN=GG_HR_Admins,OU=HR,DC=vlabs07,DC=com  
GG_IT_Admins   Global CN=GG_IT_Admins,OU=IT,DC=vlabs07,DC=com
```

Task 2: Add Members to Groups

Step 1: Add Emma Morel and Lucas Bernard to GG_HR_Admins
System: DC107 (Primary Domain Controller for vlabs07.com)

Command:

```
Add-ADGroupMember -Identity "GG_HR_Admins" -Members "e.morel", "l.bernard"
```

Explanation:

This command adds two users (Emma Morel and Lucas Bernard) to the GG_HR_Admins group using PowerShell.

- Add-ADGroupMember → Cmdlet used to add members to an AD group.
- -Identity "GG_HR_Admins" → Specifies the group were modifying.
- -Members → Lists the usernames (SamAccountName) to be added to the group.

Both users must already exist in Active Directory for this command to succeed.

To confirm the results, you can run:

```
Get-ADGroupMember -Identity "GG_HR_Admins"
```

Screenshot:

```
PS C:\Users\Administrator> Add-ADGroupMember -Identity "GG_HR_Admins" -Members "e.morel", "l.bernard"
PS C:\Users\Administrator> Get-ADGroupMember -Identity "GG_HR_Admins"

distinguishedName : CN=Emma Morel,OU=HR,DC=vlabs07,DC=com
name              : Emma Morel
objectClass       : user
objectGUID        : 3f7bd2a2-c201-43af-a811-636871693704
SamAccountName   : e.morel
SID               : S-1-5-21-2428485534-1961598418-1246186656-1110

distinguishedName : CN=Lucas Bernard,OU=HR,DC=vlabs07,DC=com
name              : Lucas Bernard
objectClass       : user
objectGUID        : f20ce90d-9708-42d5-b56e-2c9b38f66322
SamAccountName   : l.bernard
SID               : S-1-5-21-2428485534-1961598418-1246186656-1111
```

■ Step 2: Add Chloe Girard and Sophie Lambert to GG_IT_Admins
System: DC107 (**Continue using** the same server)

Command:

```
-----  
Add-ADGroupMember -Identity "GG_IT_Admins" -Members "c.girard", "s.lambert"
```

Explanation:

```
-----  
This command adds two users (Chloe Girard and Sophie Lambert) to the  
GG_IT_Admins group.
```

- -Identity "GG_IT_Admins" → The target **group for** adding members.
- -Members → Specifies the users by their SamAccountNames.

To verify the update, run:

```
Get-ADGroupMember -Identity "GG_IT_Admins"
```

Screenshot:

```
PS C:\Users\Administrator> Add-ADGroupMember -Identity "GG_IT_Admins" -Members "c.girard", "s.lambert"  
PS C:\Users\Administrator> Get-ADGroupMember -Identity "GG_IT_Admins"  
  
distinguishedName : CN=Sophie Lambert,OU=IT,DC=vlabs07,DC=com  
name : Sophie Lambert  
objectClass : user  
objectGUID : f257a14c-1ddb-4651-8e9b-b996308172fb  
SamAccountName : s.lambert  
SID : S-1-5-21-2428485534-1961598418-1246186656-1108  
  
distinguishedName : CN=Chloe Girard,OU=IT,DC=vlabs07,DC=com  
name : Chloe Girard  
objectClass : user  
objectGUID : d0ab7415-a8e8-4a0d-a9e3-cbb0dce7c6d1  
SamAccountName : c.girard  
SID : S-1-5-21-2428485534-1961598418-1246186656-1113
```

Task 3: Create Organizational Units (OUs) and Domain Local Groups

- Step 1: Create an OU named "Shared Resources"
System: DC107 (Primary Domain Controller **for** vlabs07.com)

Explanation:

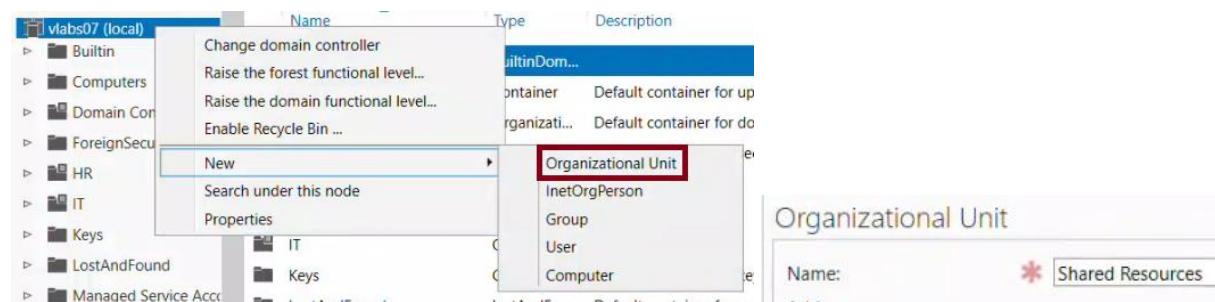

I used Active Directory Administrative Center (ADAC) to create a new Organizational Unit (OU) named "Shared Resources" at the root of the vlabs07.com domain.

I will place domain local groups inside this OU to manage shared folder access later.

Steps:

- Logged **in** to DC107
- Opened Active Directory Administrative Center
- Navigated to vlabs07.com
- Clicked "New > Organizational Unit"
- Named the OU: Shared Resources
- Clicked OK to create **it**

Screenshot:

- Step 2: Create DLG_HR_Share **using** ADAC
System: DC107

Explanation:

I created a Domain Local Security Group called DLG_HR_Share **in** the "Shared Resources" OU.

I will use this **group** to assign folder permissions **for** the HR department.

Steps:

- **In** ADAC, I navigated to the "Shared Resources" OU
- Clicked "New > Group"
- Entered:
 - Name: DLG_HR_Share
 - Group scope: Domain Local
 - Group type: Security
- Clicked OK to finish

Screenshot:

Step 3: Create DLG_IT_Share using PowerShell
System: DC107

Command:

```
New-ADGroup
  -Name "DLG_IT_Share"
  -GroupScope DomainLocal
  -GroupCategory Security
  -Path "OU=Shared Resources,DC=vlabs07,DC=com"
  -SamAccountName "DLG_IT_Share"
```

Explanation:

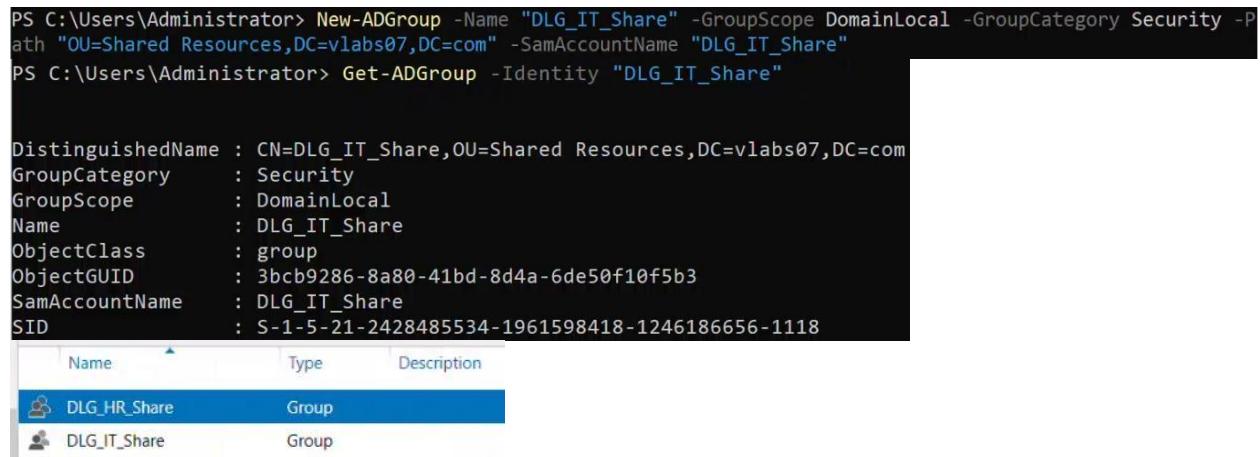

I used this command to create a Domain Local group called DLG_IT_Share inside the "Shared Resources" OU.

- -Name sets the `group` name
- -GroupScope DomainLocal makes `it` usable **for** permission assignments within the domain
- -GroupCategory Security allows `it` to be added to ACLs
- -Path sets the destination OU
- -SamAccountName defines the legacy logon name

To verify that the `group` was created, I ran:

```
Get-ADGroup -Identity "DLG_IT_Share"
```

Screenshot:

Task 4: Create a Local Group and Manage Membership

Step 1: Create a local group called LG_HR_Files
System: SRV07 (Windows Server 2025 File Server)

Explanation:

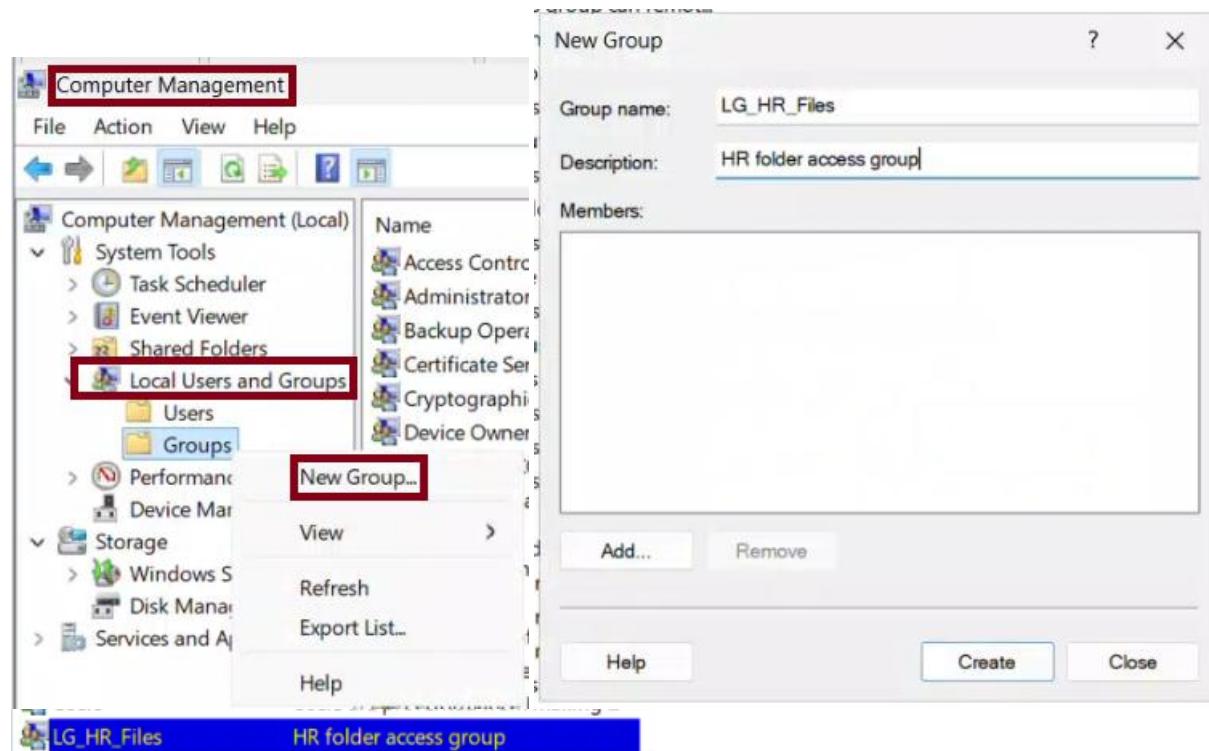

I created a local group named LG_HR_Files using the GUI in Computer Management.

This group will later be used to assign NTFS permissions to an HR folder on SRV07.

Steps:

- Logged in to SRV07
- Opened **Computer Management**
- Navigated to **Local Users and Groups > Groups**
- Right-clicked **Groups**, selected **New Group**
- Entered:
 - Group name: LG_HR_Files
 - Description: HR folder access group
- Clicked **Create**, then **Close**

Screenshot:

Step 2: Add DLG_HR_Share to LG_HR_Files

System: SRV07

Explanation:

I added the Domain Local Group **DLG_HR_Share** from Active Directory to the local group **LG_HR_Files** on SRV07. This follows the IGDLA model, where a Domain Local Group is added to a Local Group to manage local access.

Steps:

- Still in Computer Management > Local Users and Groups > Groups
- Double-clicked LG_HR_Files
- Clicked Add...
- Typed: `DLG_HR_Share`
- Clicked Check Names (confirmed it resolved from Active Directory)
- Clicked OK to add the group

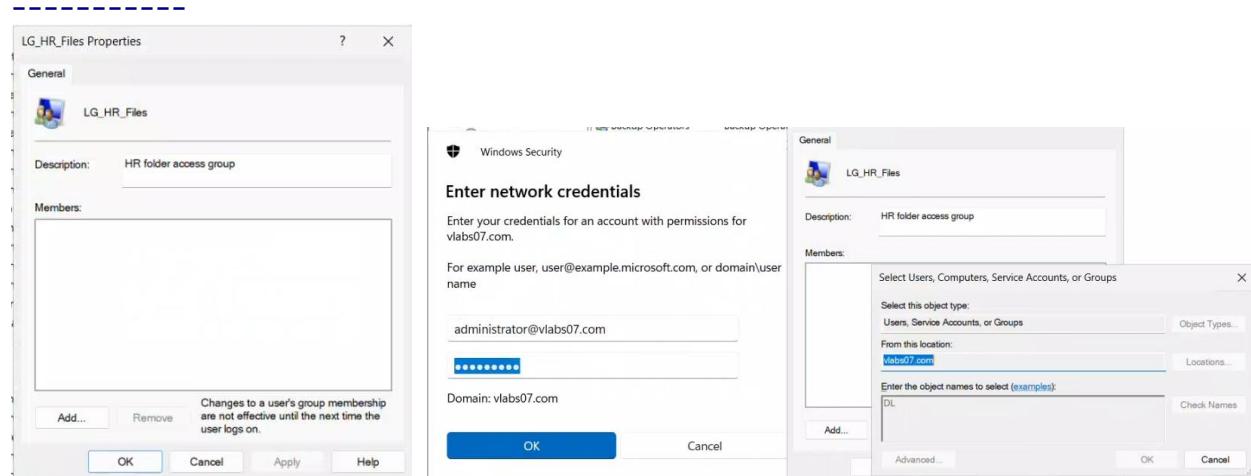

💡 At this point, Windows prompted me for domain credentials to search Active Directory. This is expected when the current login is not a domain account.

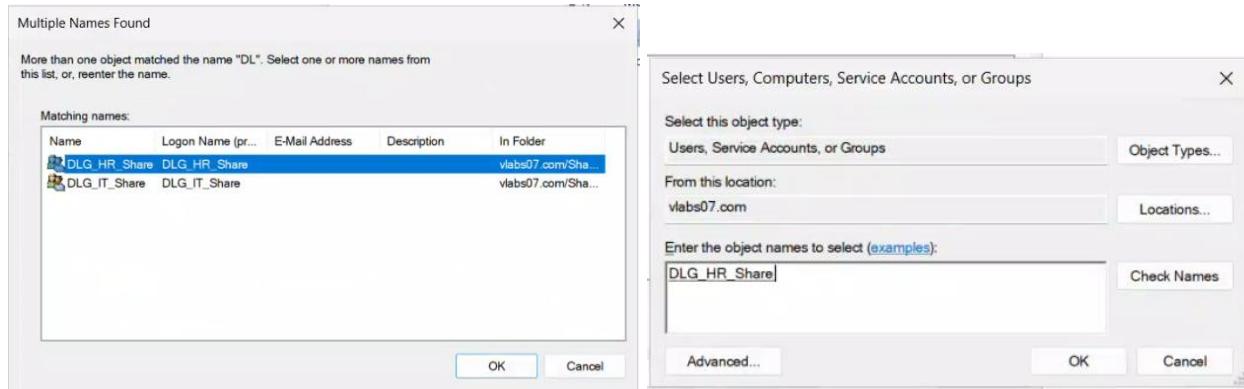

I used one of the following formats to authenticate:

```
vlabs07\administrator  
administrator@vlabs07.com
```

After authentication, the name resolved correctly and I clicked OK to add the group.

Screenshot:

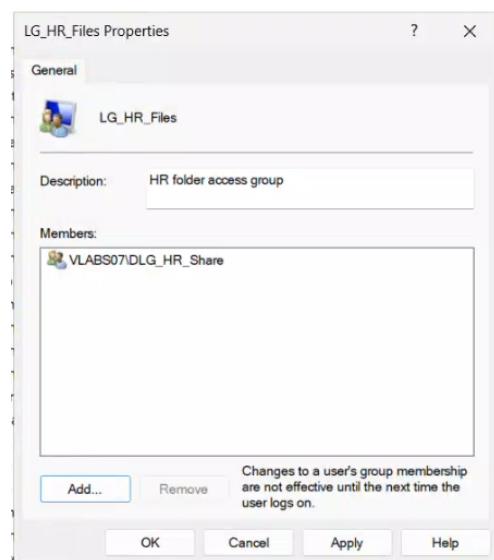

GUI Verification:

After closing the **Select Users, Computers, Service Accounts, or Groups** window, I was returned to the **LG_HR_Files Properties** dialog.

I confirmed that **DLG_HR_Share** appeared **in** the **Members** list of the group.

Then I clicked **Apply > OK** to finalize the change.

Screenshot:

■ Step 3: Verify membership of LG_HR_Files
System: SRV07

Command:

```
-----  
Get-LocalGroupMember -Group "LG_HR_Files"
```

Explanation:

```
-----  
I ran this PowerShell command to confirm that **DLG_HR_Share** was  
successfully added to **LG_HR_Files**.
```

- `Get-LocalGroupMember` lists the current members of a local `group`
- `-Group` specifies the name of the local `group` to check

The output shows that `DLG_HR_Share` is a domain-based member of the local `group`.

Screenshot:

```
PS C:\Users\Administrator> Get-LocalGroupMember -Group "LG_HR_Files"  
  
ObjectClass Name PrincipalSource  
----- ---- -----  
Group VLABS07\DLG_HR_Share ActiveDirectory
```

Task 5: Share and Set Permissions on SRV07

Step 1: Create and share the folder C:\HR_Share
System: SRV07 (Windows Server 2025 File Server)

Explanation:

I created a new folder called `HR_Share` on the C: drive of SRV07 and shared it using the GUI.

Then I configured the share permissions to grant access only to the **local group LG_HR_Files**, which controls who can access the share.

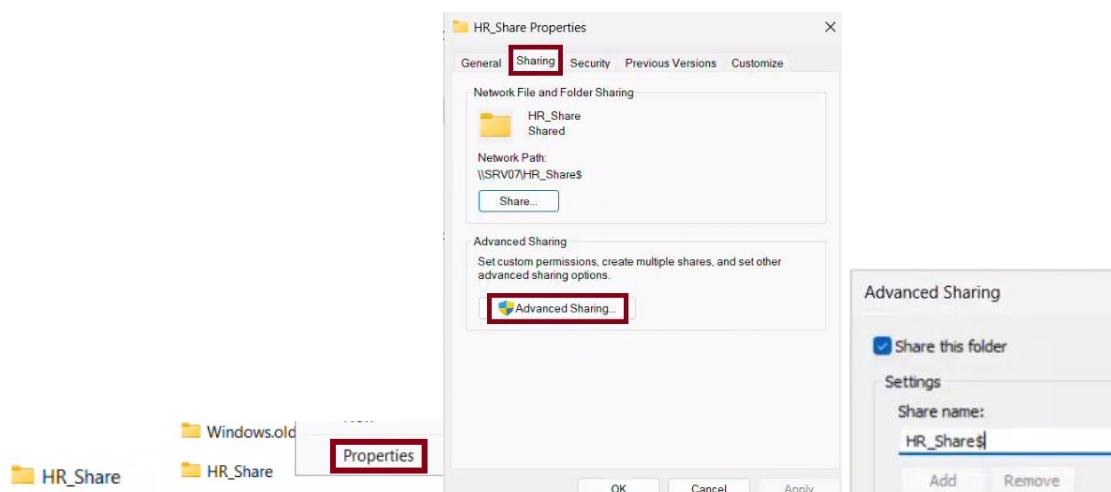

Steps:

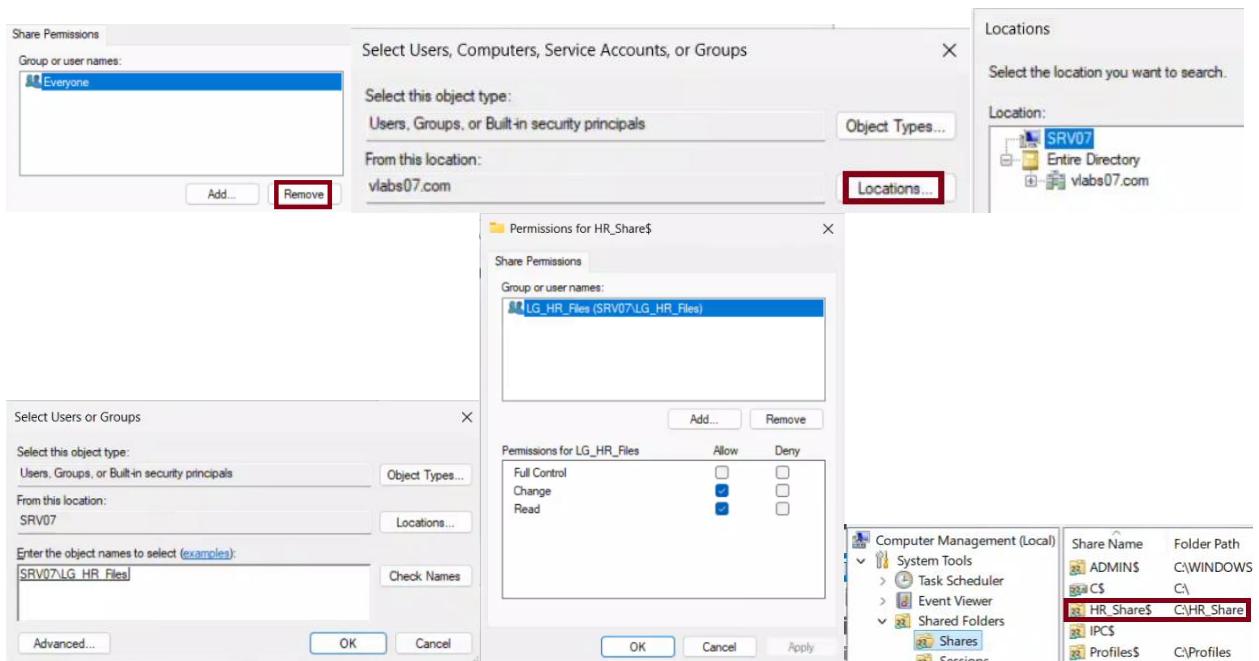

- Opened **File Explorer** on SRV07
- Created a new folder: `C:\HR_Share`
- Right-clicked the folder → **Properties**
- Went to the **Sharing** tab → clicked **Advanced Sharing**
- Checked **"Share this folder"**
- Set the **Share name** as: `HR_Share\$` *(dollar sign hides it from browsing)*
- Clicked **Permissions...**
- Removed the default **Everyone** group
- Clicked **Add...**
- In the object picker dialog:
 - Clicked **Locations**
 - Selected **SRV07** *(very important: LG_HR_Files is a local group)*
 - Clicked **OK**
 - Entered: `LG_HR_Files` → clicked **Check Names** to resolve it
 - Clicked **OK**
- Selected LG_HR_Files in the list and checked **Full Control**
- Clicked **OK > OK > Close**

Note:
LG_HR_Files is a **local group**, so it only exists on SRV07. If you leave the default domain (vlabs07.com) selected in the "From this location" box, the group wont be found. You must switch to SRV07 to resolve it.

Screenshot:

Step 2: Set NTFS permissions for LG_HR_Files
System: SRV07 (Windows Server 2025 File Server)

Explanation:

I configured NTFS permissions on the `C:\HR_Share` folder so that only members of **LG_HR_Files** have the ability to read, write, and modify files.

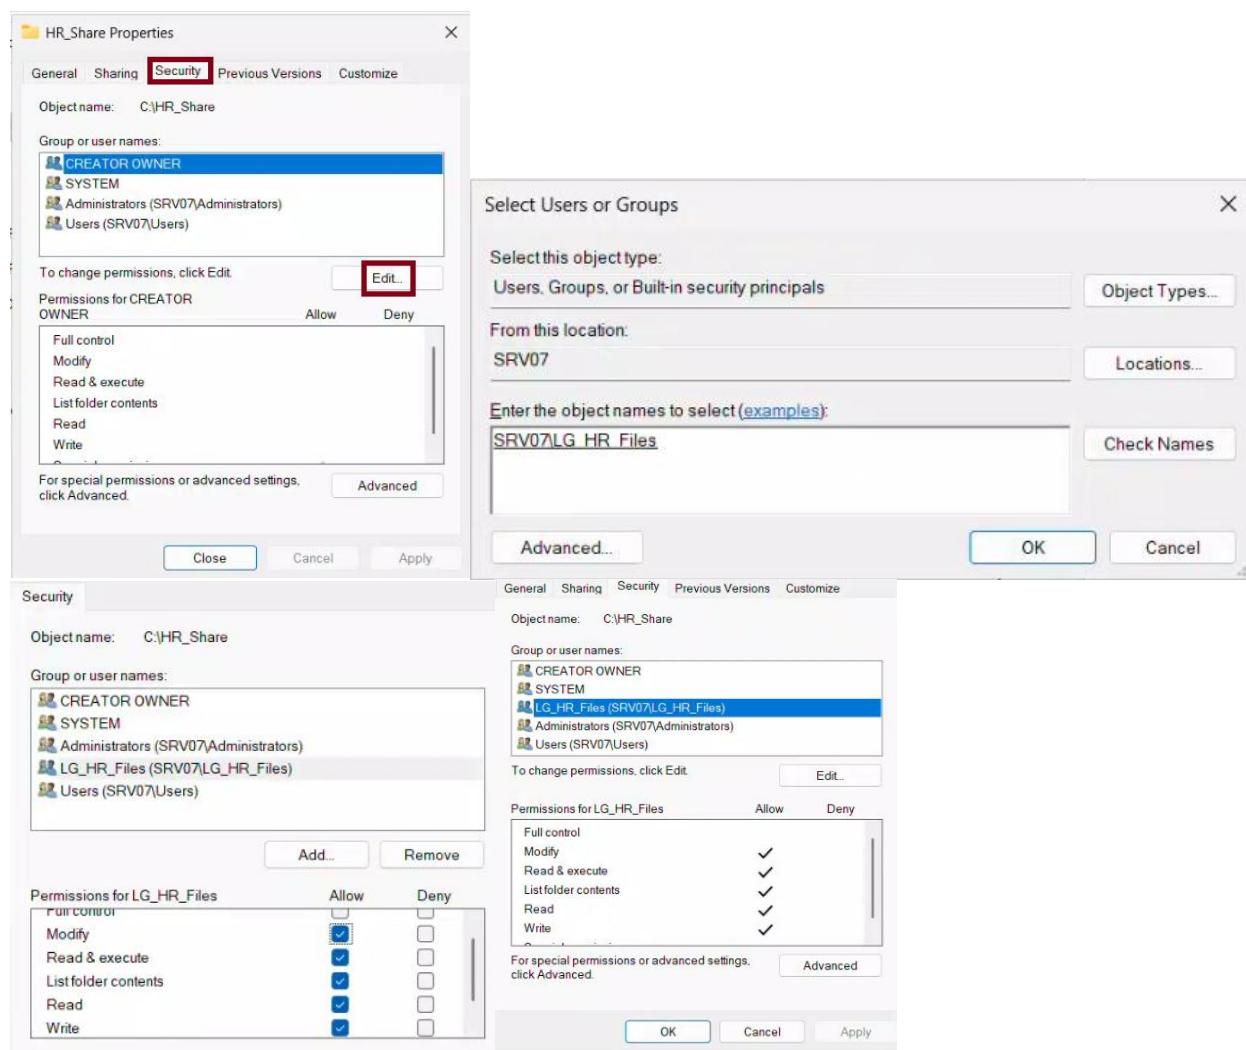

I also confirmed that **Everyone** was not present, so no removal was needed.

Steps:

- Right-clicked `C:\HR_Share` → selected **Properties**
- Went to the **Security** tab
- Clicked **Edit...**
- In the Permissions window:
 - Verified that **Everyone** was not present
 - Clicked **Add...**
 - In the object picker:
 - Clicked **Locations...**
 - Selected **SRV07** as the search location (**LG_HR_Files** is a local group)
 - Clicked **OK**
 - Entered: `LG_HR_Files` and clicked **Check Names**
 - The name resolved as: `SRV07\LG_HR_Files`
 - Clicked **OK**

- With `LG_HR_Files` selected:
 - Checked **Modify**
 - Confirmed that other required permissions (Read & Execute, List Folder Contents, Read, Write) were auto-checked
 - Did not check **Full Control**
- Clicked **Apply > OK > OK** to finalize the NTFS settings

Screenshot:

■ Step 3: Verify the share and permissions using PowerShell
System: SRV07

Command:

```
-----  
Get-SmbShare -Name "HR_Share$"  
Get-SmbShareAccess -Name "HR_Share$"
```

Explanation:

I used these PowerShell commands to confirm that the `HR_Share\$` folder was successfully shared and that access permissions were applied correctly.

- `Get-SmbShare` shows the list of all configured shares, including their path and properties.
- `-Name "HR_Share\$"` filters for the specific hidden share I created earlier.
- `Get-SmbShareAccess` displays the access control list (ACL) for the share, including what permissions each user or group has.

The output should confirm that:

- The share path is `C:\HR_Share`
- The group `LG_HR_Files` has **Full** or **Change** access, depending on what was configured in the GUI

Screenshot:

```
PS C:\Users\Administrator> Get-SmbShare -Name "HR_Share$"  
  
Name      ScopeName Path          Description  
----      -----   --  
HR_Share$ *           C:\HR_Share  
  
PS C:\Users\Administrator> Get-SmbShareAccess -Name "HR_Share$"  
  
Name      ScopeName AccountName      AccessControlType AccessRight  
----      -----   -----          -----          -----  
HR_Share$ *           SRV07\LG_HR_Files Allow          Change
```

Task 6: Test HR Share Access from Client07

■ Step 1: Log **in** as Lucas Bernard (**l.bernard**)
System: Client07 (Windows **11** Client)

Explanation:

I logged **in** to Client07 **using** the domain user ****Lucas Bernard****, whose username is **`l.bernard`**.

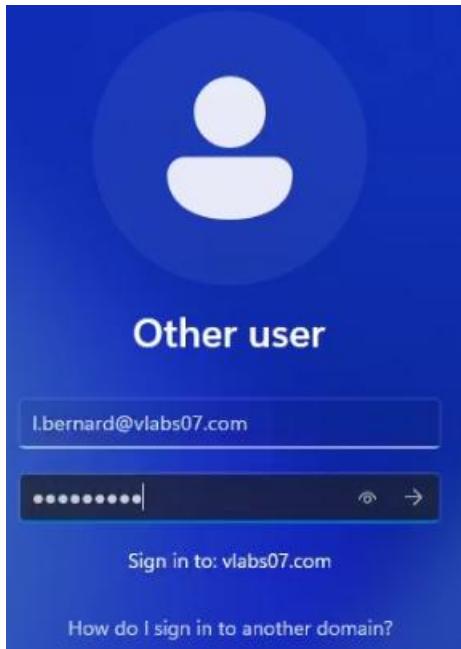

Lucas is a member of **`GG_HR_Admins`**, which is a member of **`DLG_HR_Share`**, and that **group** was added to **`LG_HR_Files`** on SRV07.

This structure follows the **IGDLA** model and **should** give him access to the HR shared folder.

Steps:

- Started ****Client07**** (Windows **11**)
- Logged **in** with:
 - Username: **`l.bernard`**
 - Password: ***(provided by the instructor or domain default)***

Screenshot:

Step 2: Access \\SRV07\HR_Share\$ and test file access
System: Client07

Command:

Open File Explorer manually and enter the UNC path below:
\\SRV07\HR_Share\$

Then, in the shared folder:

1. Right-click > New > Text Document
2. Name it: lucas_test.txt
3. Open and type: Test from Lucas
4. Save and close the file
5. Right-click the file and select Delete

Explanation:

I logged in as Lucas Bernard on Client07 and opened File Explorer.

Since the share HR_Share\$ is hidden, I manually entered the full UNC path:
\\SRV07\HR_Share\$

The folder opened successfully, confirming Lucas had inherited access through:

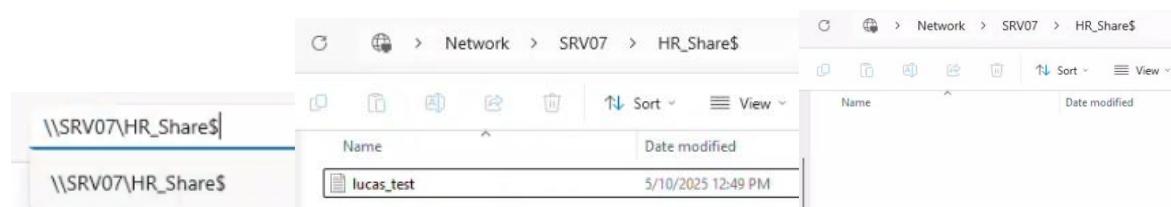

GG_HR_Admins → DLG_HR_Share → LG_HR_Files

To test Modify permission, I created a new file, saved it, then deleted it.

All operations completed without error, confirming that:

- NTFS permission = Modify
- Share permission = Change

Screenshot:

■ Step 3: Resolve access issue by completing **group** inheritance
System: DC107

Command:

```
-----  
Add-ADGroupMember -Identity "DLG_HR_Share" -Members "GG_HR_Admins"
```

Explanation:

```
-----  
While testing access as Lucas Bernard, I received an access denied message  
when trying to reach the share \\SRV07\HR_Share$.
```

After investigation, I found that the Global **Group** `GG_HR_Admins` was not yet added to the Domain Local **Group** `DLG_HR_Share`.

According to the IGDIA model, I must nest the Global **Group** inside the Domain Local **Group** to allow permission inheritance.

This command adds `GG_HR_Admins` to `DLG_HR_Share`, completing the **group** chain:

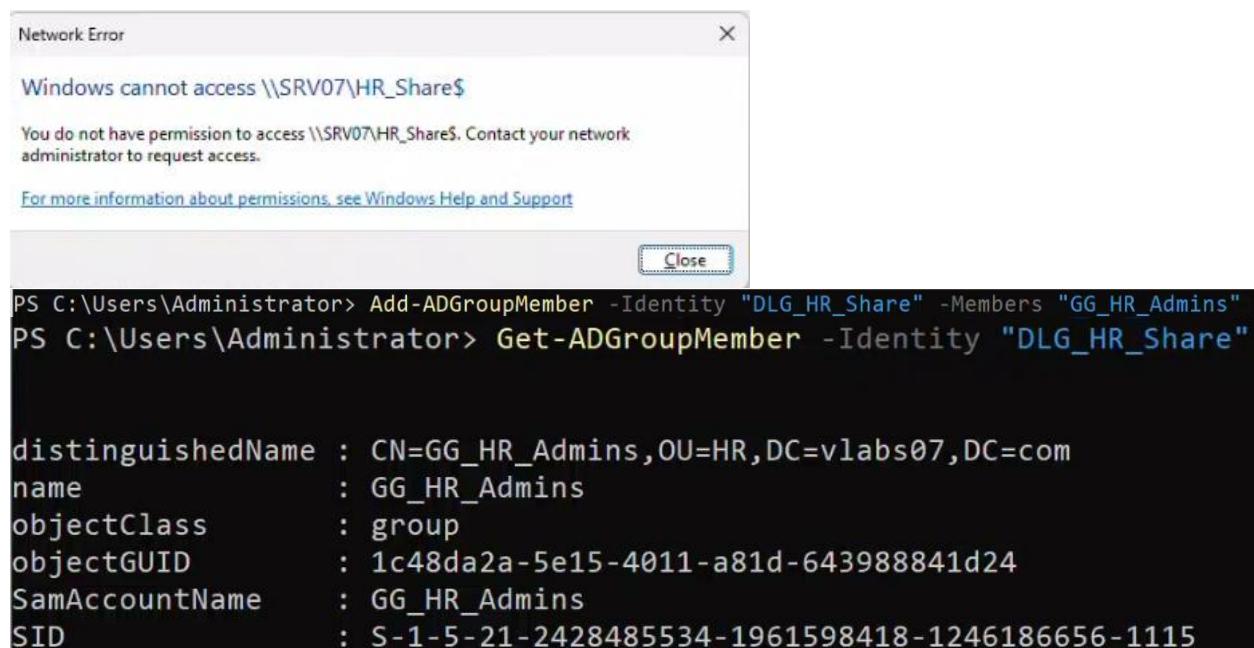

```
GG_HR_Admins → DLG_HR_Share → LG_HR_Files
```

To verify:

```
Get-ADGroupMember -Identity "DLG_HR_Share"
```

After running this, I was able to access the share from Client07 as Lucas Bernard.

Screenshot:

Task 7: Remove a User from a Group and Delete a User

Step 1: Remove Emma Morel from GG_HR_Admins using ADAC System: DC107

Command:

No PowerShell command – this step is completed using ADAC (Active Directory Administrative Center)

GUI Actions:

1. Open Active Directory Administrative Center (ADAC) on DC107
2. Navigate to: vlabs07.com > HR
3. Double-click GG_HR_Admins
4. Under Members, locate and select "Emma Morel (e.morel)"
5. Click Remove
6. Click OK to confirm and Apply to save changes

Explanation:

I used the ADAC interface to remove user ****Emma Morel**** from the global group `GG_HR_Admins`.

This simulates revoking share access permissions that were granted indirectly through the IGDLA structure.

After removal, Emma **should** no longer have access to the HR shared folder.

Screenshot:

The screenshot displays three windows from the ADAC interface:

- Left Window (Navigation):** Shows the navigation tree under 'vlabs07 (local)' with 'HR' selected. Other items include 'Builtin', 'Computers', 'Domain Controllers', and 'ForeignSecurityPrincipals'. A list of objects is shown on the right: Emma Morel (User), GG_HR_Admins (Group), HR Template (User), and Lucas Bernard (User).
- Middle Window (GG_HR_Admins Properties):** The 'Members' tab is selected. It shows a list of members: Emma Morel and Lucas Bernard. The entry for Emma Morel is highlighted with a red box. A 'Remove' button is visible at the bottom right of the list.
- Bottom Window (GG_HR_Admins Properties):** The 'Members' tab is selected. It shows a list of members: Lucas Bernard. The entry for Lucas Bernard is highlighted with a red box.

■ Step 2: Remove Chloe Girard from GG_IT_Admins using PowerShell
System: DC107

Command:

```
-----  
Remove-ADGroupMember -Identity "GG_IT_Admins" -Members "c.girard" -  
Confirm:$false
```

Explanation:

```
-----  
I removed user **Chloe Girard (c.girard)** from the global group  
'GG_IT_Admins' using the `Remove-ADGroupMember` cmdlet.
```

- `-Identity` specifies the **group** to remove the member from
- `-Members` specifies the user account to remove
- `-Confirm:\$false` skips the confirmation **prompt**

This change removes Chloe's inherited access to any shared resources linked to `GG_IT_Admins`.

Screenshot:

```
PS C:\Users\Administrator> Remove-ADGroupMember -Identity "GG_IT_Admins" -Members "c.girard"  
Confirm  
Are you sure you want to perform this action?  
Performing the operation "Set" on target "CN=GG_IT_Admins,OU=IT,DC=vlabs07,DC=com".  
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is "Y"): Y  
PS C:\Users\Administrator> Get-ADGroupMember -Identity "GG_IT_Admins"  
  
distinguishedName : CN=Sophie Lambert,OU=IT,DC=vlabs07,DC=com  
name : Sophie Lambert  
objectClass : user  
objectGUID : f257a14c-1ddb-4651-8e9b-b996308172fb  
SamAccountName : s.lambert  
SID : S-1-5-21-2428485534-1961598418-1246186656-1108
```

Task 8: Create IT OU and Configure Groups on DC307 and DC107

Step 1: Create an IT OU using ADAC
System: DC307

Command:

This task is completed using the GUI (ADAC)

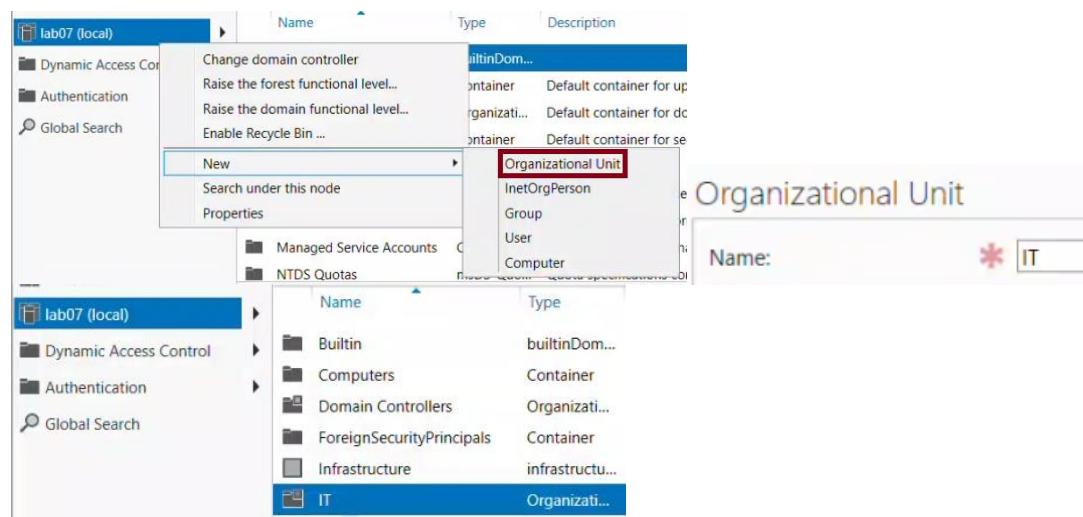

GUI Actions:

1. Open Active Directory Administrative Center on DC307
2. Right-click the domain lab07.vlabs07.com
3. Select New > Organizational Unit
4. Name the OU: IT
5. Click OK

Explanation:

I created a new Organizational Unit named **IT** in the child domain **lab07.vlabs07.com** using ADAC.

Screenshot:

Step 2: Create user Fadi Tora (f.tora) inside the IT OU using ADAC System: DC307

Command:

Completed using ADAC GUI

GUI Actions:

1. In the IT OU, right-click > New > User
2. First name: Fadi
3. Last name: Tora
4. Full Name: Fadi Tora
5. User logon name: f.tora
6. Set a password and uncheck "User must change password at next logon"
7. Click OK

Explanation:

I created a new user **Fadi Tora (f.tora)** inside the **IT OU** under the child domain. This user will later be added to the IT group for cross-domain group nesting.

Screenshot:

The screenshot shows the ADAC GUI interface. At the top, a context menu is open over the 'IT' organizational unit. The 'New' option is selected, and a submenu is displayed with 'User' highlighted and surrounded by a red box. Below the menu, the 'Account' tab is active, showing the configuration for a new user account. The 'First name' field contains 'Fadi', 'Last name' contains 'Tora', and 'Full name' is 'Fadi Tora'. The 'User UPN logon' field is set to 'f.tora' and 'User SamAccountName' is 'lab07'. The 'Password' and 'Confirm password' fields both contain '*****'. On the right side of the screen, there are sections for 'Account expires' (set to 'Never'), 'Password options' (set to 'Other password options'), and 'Encryption options'. At the bottom, the 'IT (1)' section shows a single user entry: 'Name' followed by 'Fadi Tora'.

Step 3: Create GG_IT_Admins and add Fadi Tora to it using ADAC System: DC307

Command:

Completed using ADAC GUI

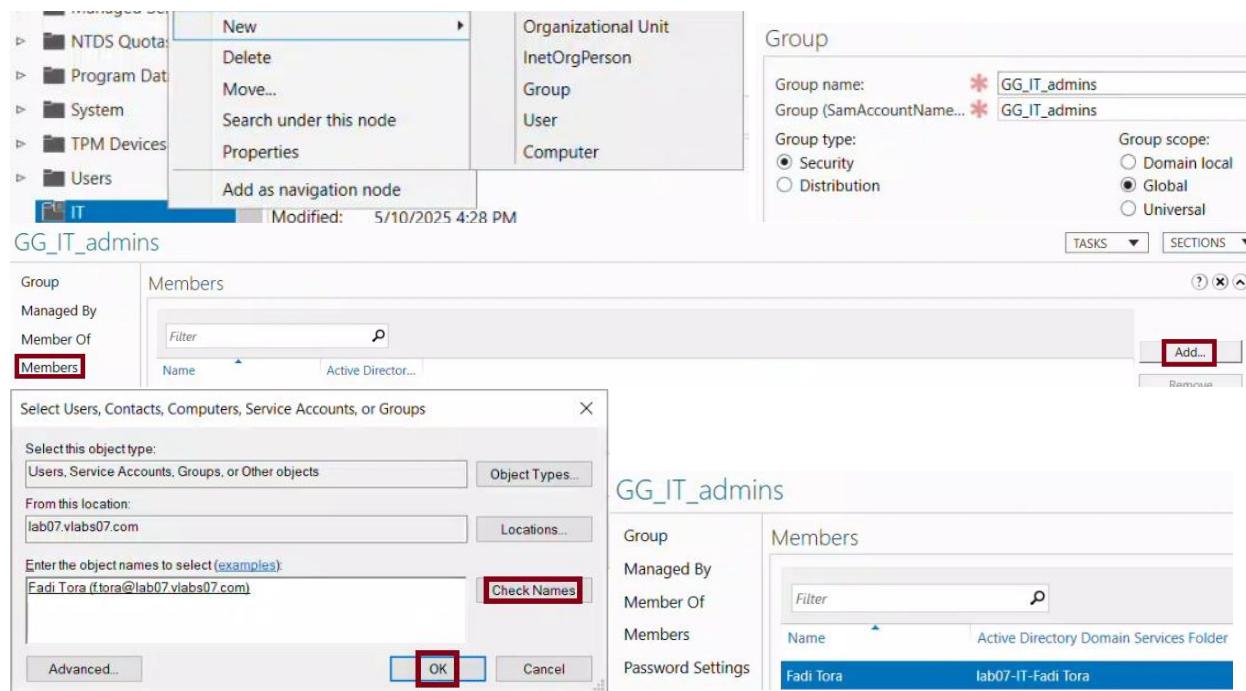

GUI Actions:

1. In the IT OU, right-click > New > Group
2. Group name: GG_IT_Admins
3. Group type: Security
4. Group scope: Global
5. Click OK
6. Open GG_IT_Admins > Members > Add
7. Add: f.tora > Check Names > OK > Apply

Explanation:

I created a Global Group called **GG_IT_Admins** inside the IT OU in lab07.vlabs07.com, and added **Fadi Tora** as a member. This group will be added to a Universal Group on DC107.

Screenshot:

Step 4: Create UG_IT_Global on DC107
System: DC107

Command:

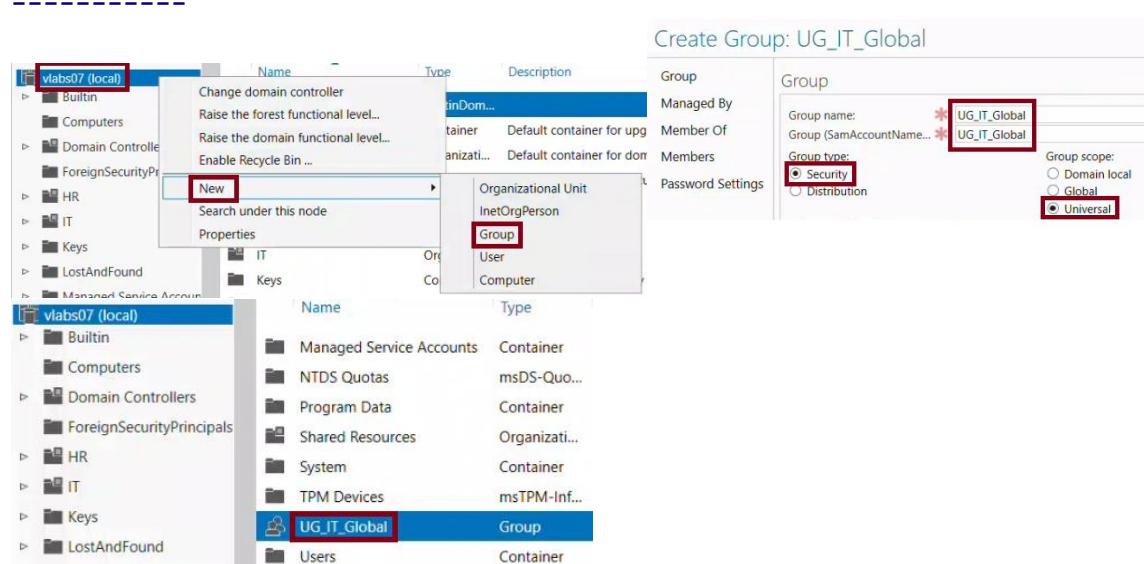

GUI Method (ADAC):

1. Open ADAC on DC107
2. Navigate to vlabs07.com domain
3. Right-click > New > Group
4. Group name: UG_IT_Global
5. Group scope: Universal
6. Group type: Security
7. Click OK

Explanation:

I created a Universal Group named **UG_IT_Global** in the parent domain (**vlabs07.com**) using ADAC. This group will unify Global Groups from both domains.

Screenshot:

Step 5: Add GG_IT_Admins (from both domains) to UG_IT_Global
System: DC107

Command:

GUI Method (ADAC):

1. Open UG_IT_Global > Members > Add
2. Add:
 - GG_IT_Admins from vlabs07.com
 - GG_IT_Admins from lab07.vlabs07.com
3. Use Locations button to browse both domains **if** needed
4. Confirm both are listed
5. Click OK

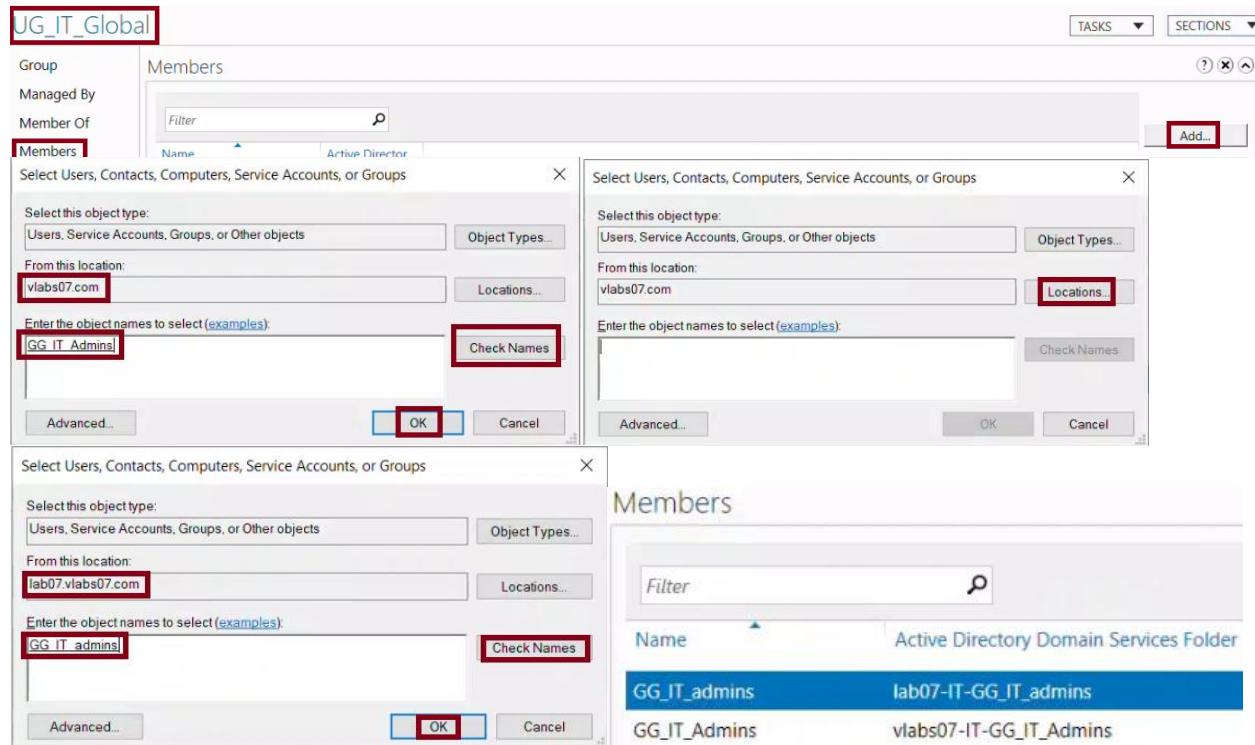

Explanation:

I added both instances of **GG_IT_Admins** from:

- The **parent domain (vlabs07.com)**
- The **child domain (lab07.vlabs07.com)**

to the **Universal Group UG_IT_Global**. This allows cross-domain user membership to be centralized.

Screenshot:

■ Step 6: Add UG_IT_Global to DLG_IT_Share using PowerShell
System: DC107

Command:

```
-----  
Add-ADGroupMember -Identity "DLG_IT_Share" -Members "UG_IT_Global"
```

Explanation:

```
-----  
I used PowerShell to nest the Universal Group **UG_IT_Global** inside the  
Domain Local Group **DLG_IT_Share**.
```

This follows the IGDIA group structure and allows users from both domains to inherit access to shared resources through `DLG_IT_Share`.

Verification:

```
-----  
To confirm the group nesting, I used the following command:  
Get-ADGroupMember -Identity "DLG_IT_Share"
```

The output displayed `UG_IT_Global` as a member, confirming that the group was added successfully.

Screenshot:

```
PS C:\Users\Administrator> Add-ADGroupMember -Identity "DLG_IT_Share" -Members "UG_IT_Global"  
PS C:\Users\Administrator> Get-ADGroupMember -Identity "DLG_IT_Share"  
  
distinguishedName : CN=UG_IT_Global,DC=vlabs07,DC=com  
name : UG_IT_Global  
objectClass : group  
objectGUID : c06a6298-edd2-441c-b7a7-3d2a0a52bafb  
SamAccountName : UG_IT_Global  
SID : S-1-5-21-2428485534-1961598418-1246186656-1119
```

Task 9: Share and Set Permissions for IT Global Share

Step 1: Create and share C:\IT_Share_Global using GUI
System: SRV07

Command:

GUI Method:

1. On SRVXX, open File Explorer and navigate to C:\
2. Create a new folder named: IT_Share_Global
3. Right-click the folder > Properties > Sharing tab
4. Click "Advanced Sharing"
5. Check "Share this folder"
6. Share name: IT_Share_Global\$
7. Click "Permissions" → Remove "Everyone"
8. Click "Add" → Add UG_IT_Global and grant "Change" + "Read" permissions
9. Click OK to close all dialogs

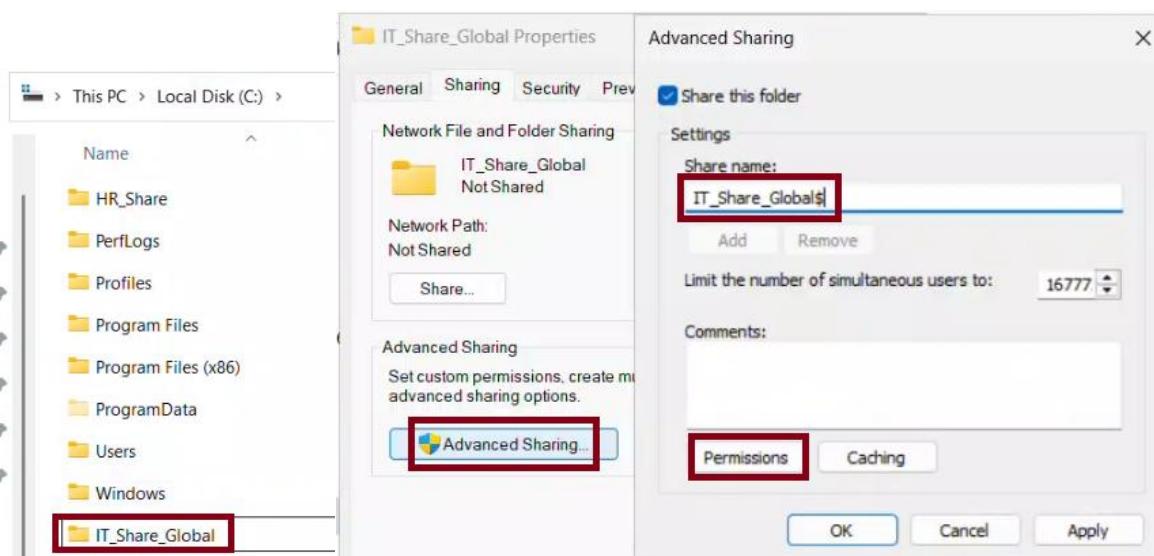

Explanation:

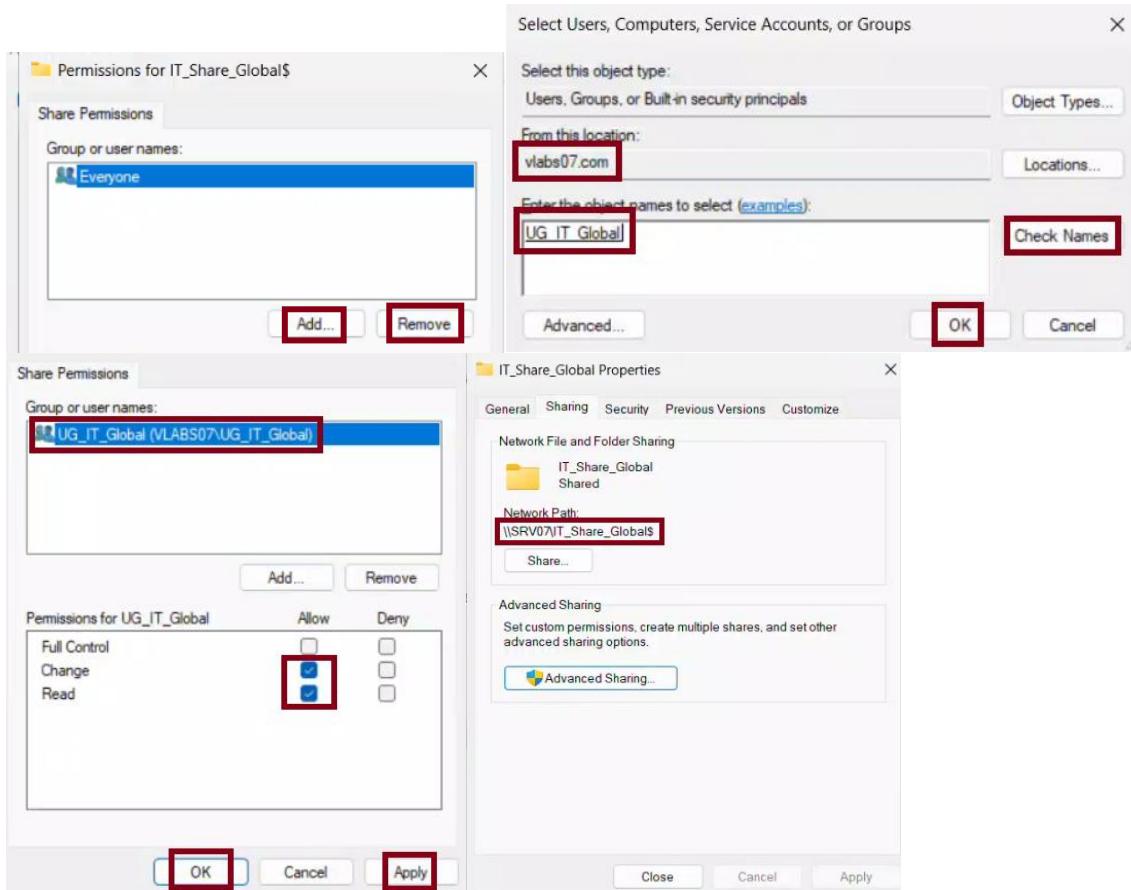

I created and shared a new folder named `C:\IT_Share_Global` on the file server **SRV07** using the GUI.

The share name used a `'\$` suffix to make it hidden: `IT_Share_Global\$`.

I removed the default `Everyone` group and assigned **Change permissions** to the **UG_IT_Global** group, following the lab's access control instructions.

Screenshot:

■ Step 2: Assign NTFS permissions (Change) to UG_IT_Global using GUI System: SRV07

Command:

GUI Method:

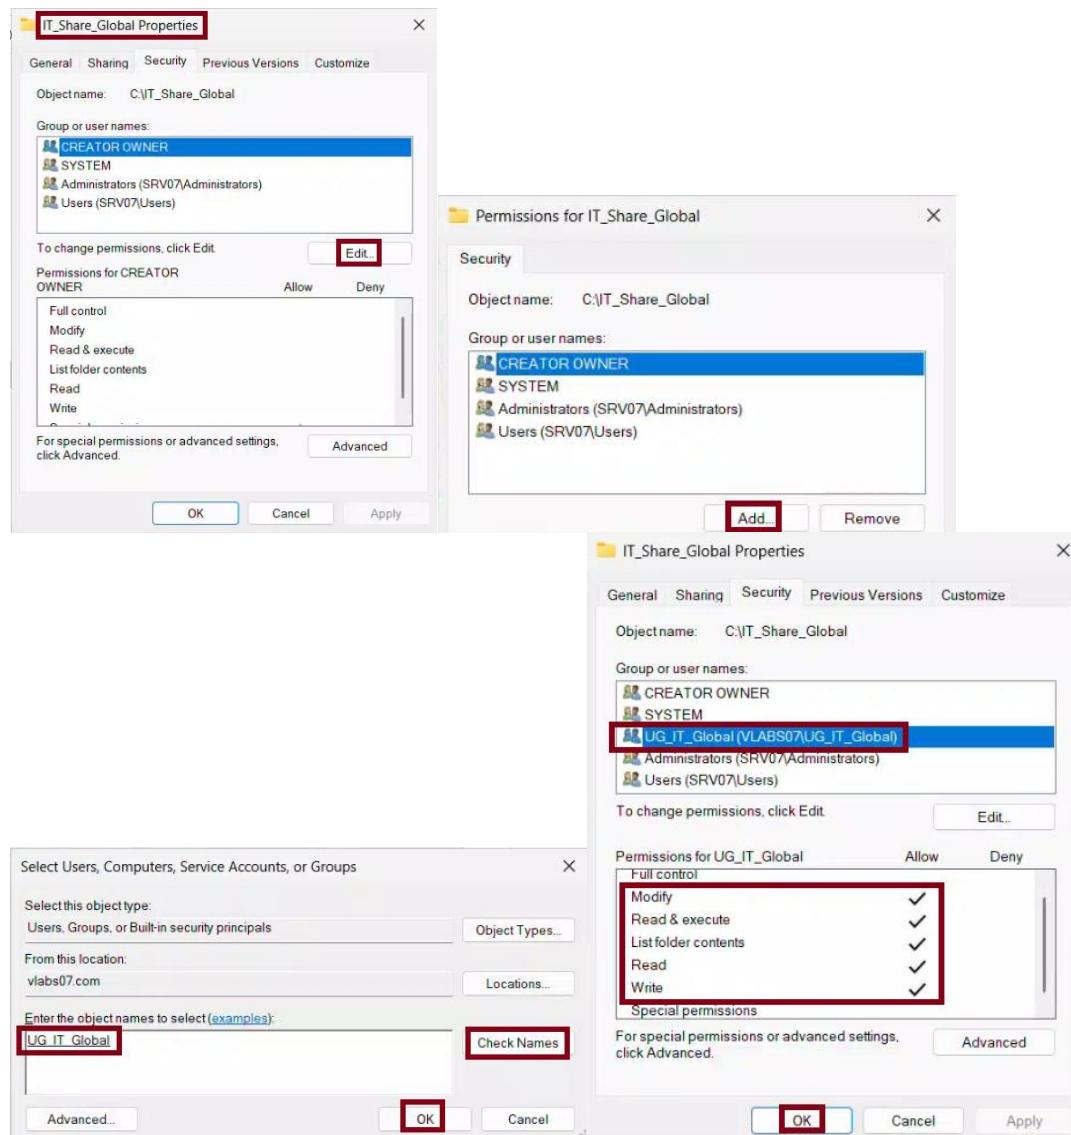

1. Go to the Security tab of the IT_Share_Global folder
2. Click Edit → Add → Enter: UG_IT_Global
3. Grant the group the following NTFS permissions:
 - Modify
 - Read & execute
 - List folder contents
 - Read
 - Write
4. Click Apply and OK to close all dialogs

Explanation:

I configured NTFS permissions on `C:\IT_Share_Global` so that the group **UG_IT_Global** has full **Modify-level access**.

This complements the share-level "Change" permissions to ensure the group can fully read, write, and delete files.

Screenshot:

Step 3: Verify the share and permissions using PowerShell
System: SRV07

Command:

```
Get-SmbShare -Name "IT_Share_Global$"
Get-SmbShareAccess -Name "IT_Share_Global$"
```

Explanation:

I used PowerShell to verify that the `IT_Share_Global\$` share was created correctly and that **UG_IT_Global** has "Change" access.

These cmdlets confirm both the share path and the assigned access control.

Screenshot:

```
PS C:\Users\Administrator> Get-SmbShare -Name "IT_Share_Global$"
Name          ScopeName Path          Description
---          -----
IT_Share_Global$ *      C:\IT_Share_Global

PS C:\Users\Administrator> Get-SmbShareAccess -Name "IT_Share_Global$"
Name          ScopeName AccountName      AccessControlType AccessRight
---          -----
IT_Share_Global$ *      VLABS07\UG_IT_Global Allow           Change
```

Task 10: Test IT Share Access from Client07

█ Step 1: Log **in** as Fadi Tora (**f.tora**)
System: Client07 (Windows **11**)

Command:

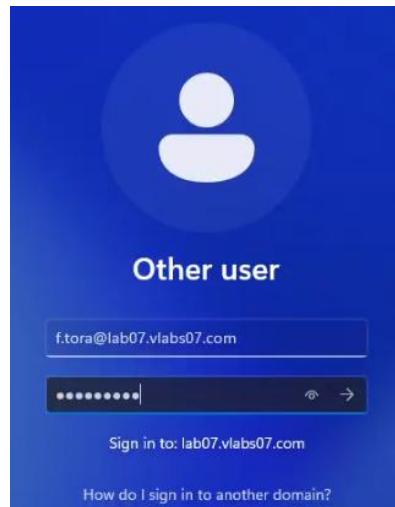

GUI Method:

1. Sign out of the current user session on Client07
2. Log **in** as:
 Username: f.tora
 Domain: lab07.vlabs07.com

Explanation:

I logged into the domain-joined Windows **11** client (**Client07**) **using** the account **Fadi Tora (f.tora)**, which was created earlier **in** the child domain `lab07.vlabs07.com`.

Screenshot:

█ Step 2: Check **group** membership of **f.tora** **using** Command **Prompt**
System: Client07

Command:

`whoami /groups`

Explanation:

I opened Command **Prompt** and used `whoami /groups` to list all security groups that the user ****f.tora**** is currently a member of.

This output confirms the users indirect membership **in** **UG_IT_Global**, which grants access to the shared folder.

Screenshot:

GROUP INFORMATION			
Group Name	Type	SID	Attributes
Everyone	Well-known group	S-1-1-0	Mandatory group, En
abled by default, Enabled group			
BUILTIN\Users	Alias	S-1-5-32-545	Mandatory group, En
abled by default, Enabled group			
NT AUTHORITY\INTERACTIVE	Well-known group	S-1-5-4	Mandatory group, En
abled by default, Enabled group			
CONSOLE LOGON	Well-known group	S-1-2-1	Mandatory group, En
abled by default, Enabled group			
NT AUTHORITY\Authenticated Users	Well-known group	S-1-5-11	Mandatory group, En
abled by default, Enabled group			
NT AUTHORITY\This Organization	Well-known group	S-1-5-15	Mandatory group, En
abled by default, Enabled group			
LOCAL	Well-known group	S-1-2-0	Mandatory group, En
abled by default, Enabled group			
LAB07\GG_IT_admins	Group	S-1-5-21-987840292-880875472-4280997625-1105	Mandatory group, En
abled by default, Enabled group

abled by default, Enabled group			
Authentication authority asserted identity	Well-known group	S-1-18-1	Mandatory group, En
abled by default, Enabled group			
VLABS07\DLG_IT_Share	Alias	S-1-5-21-2428485534-1961598418-1246186656-1118	Mandatory group, En
abled by default, Enabled group, Local Group			
Mandatory Label\Medium Mandatory Level	Label	S-1-16-8192	

Step 3: Access \\SRV07\IT_Share_Global\$ and test permissions
System: Client07

Command:

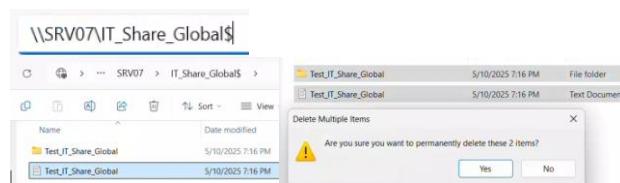

-
- GUI Method:
1. Open File Explorer
 2. In the address bar, type:
\\SRV07\IT_Share_Global\$
 3. Press Enter
 4. Inside the folder, right-click > New > Text Document
 5. Create, rename, and delete the file to confirm full write access

Explanation:

I accessed the **hidden** network share `\\SRV07\IT_Share_Global\$` from File Explorer.

I then created and deleted a file inside the folder to confirm that ****f.tora****, through the **group **UG_IT_Global****, has the correct ****read/write (Change)**** permissions set on both the share and NTFS levels.

Screenshot:

Task 11: Change Group Scope

- Step 1: Remove Cross-Domain Member Before Conversion

Command:

```
Remove-ADGroupMember -Identity "UG_IT_Global" -Members "GG_IT_admins" -Confirm:$false
```

Explanation:

Before converting a Universal `group` to a Global `group`, any cross-domain members must be removed.

In our case, **GG_IT_admins** from the child domain `lab07.vlabs07.com` was removed from **UG_IT_Global** to allow the `group` scope change.

Screenshot:

```
PS C:\Users\Administrator> Remove-ADGroupMember -Identity "UG_IT_Global" -Members "GG_IT_admins" -Confirm:$false
```

- Step 2: Change `Group` Scope to Global

Command:

```
Set-ADGroup -Identity "UG_IT_Global" -GroupScope Global
```

Explanation:

With the child domain `group` removed, I changed the scope of **UG_IT_Global** from **Universal** to **Global** using PowerShell.

This change is required **for** environments `where` Global scope is preferred or needed **for** compatibility.

Screenshot:

```
PS C:\Users\Administrator> Set-ADGroup -Identity "UG_IT_Global" -GroupScope Global
```

- Step 3: Confirm **in** GUI (ADAC)

Action:

1. Open Active Directory Administrative Center on DC107
2. Navigate to `vlabs07.com > UG_IT_Global`
3. Check the `group` properties

Explanation:

I confirmed that the `group` scope is now **Global** by viewing the properties of **UG_IT_Global** inside ADAC.

Screenshot:

The screenshot shows a Windows Group Properties dialog box. On the left, a sidebar lists options: Group, Managed By, Member Of, Members, Password Settings, and Extensions. The main area is titled 'Group' and contains the following fields:

- Group name: **UG_IT_Global** (highlighted with a red box)
- Group (SamAccountName...): **UG_IT_Global**
- Group type:
 - Security
 - Distribution
- Group scope:
 - Domain local
 - Global
 - Universal
